And before I deal with these equations in particular, let's just remind ourselves about when we might have one or infinite or no solutions. You're going to have one solution if you can, by solving the equation, come up with something like x is equal to some number. Let's say x is equal to-- if I want to say the abstract-- x is equal to a .

Section 2-1 : Linear Differential Equations. The first special case of first order differential equations that we will look at is the linear first order differential equation. In this case, unlike most of the first order cases that we will look at, we can actually derive a formula for the general solution. The general solution is derived below.

Solutions to Linear Systems The analysis of linear systems will begin by determining the possibilities for the solutions. Despite the fact that the system can contain any number of equations, each of which can involve any number of unknowns, the result that describes the possible number of solutions to a linear system is simple and definitive.

Purplemath "Linear" equations are equations with just a plain old variable like "x", rather than something more complicated like x^2 , or x/y , or square roots, or other more-complicated expressions. Linear equations are the simplest equations that you'll deal with. You've probably already solved linear equations; you just didn't know it.
