We will try to follow the textbook: Measure and integral by Wheeden and Zygmund, but of course, we can only cover part of the textbook. Note that Chapter 1 provide a quick review of what you supposed to learn before, I will spend a bit more time on Riemann integrals (on \mathbb{R}^n).

Egorov's Theorem. Let (X, \mathcal{M}, μ) be a measure space and let E be a measurable set with $\mu(E) < \infty$. Let $\{f_n\}$ be a sequence of measurable functions on E such that each f_n is finite almost everywhere in E and converges almost everywhere in E to a finite limit f . Then for every $\epsilon > 0$, there exists a subset A of E with $\mu(A) < \epsilon$ such that f_n converges uniformly on $E \setminus A$. If \mathcal{M} is either the class of Borel sets or the class of Lebesgue measurable sets, then the ...

Egorov's Theorem -- from Wolfram MathWorld

Summary. Now considered a classic text on the topic, Measure and Integral: An Introduction to Real Analysis provides an introduction to real analysis by first developing the theory of measure and integration in the simple setting of Euclidean space, and then presenting a more general treatment based on abstract notions characterized by axioms and with less geometric content.
