Marine propulsion is the mechanism or system used to generate thrust to move a ship or boat across water. While paddles and sails are still used on some smaller boats, most modern ships are propelled by mechanical systems consisting of an electric motor or engine turning a propeller, or less frequently, in pump-jets, an impeller.

### **Marine propulsion - Wikipedia**

The maintenance of and grades of fuel and lubricating oils used in marine diesel engines plays a vital part in the efficiency of the engine. A lubricating oil centrifuge is in closed circuit with the sump constantly cleaning the oil. These measures of keeping the fuel and lubricating oils clean and at the optimum operating temperatures are the responsibility of the senior watchkeeping engineer.

### **Diesel Engines Fuel Treatment on Ships**

On some ships, the machinery space may comprise more than one engine room, such as forward and aft, or port or starboard engine rooms, or may be simply numbered. On a large percentage of vessels ships and boats, the engine room is located near the bottom, and at the rear, or aft, end of the vessel, and usually comprises few compartments.
