Linear algebra moves steadily to  $n$  vectors in  $m$ -dimensional space. We still want combinations of the columns (in the column space). We still get  $m$  equations to produce  $b$  (one for each row). Those equations may or may not have a solution. They always have a least-squares solution. The interplay of columns and rows is the heart of linear algebra.

Therefore, the system has no solution, and the vectors are not parallel. All the equations give  $c = -3$ . Therefore, the system has a solution, and the vectors are parallel. All the equations give  $c = -1$ .

Gilbert Strang's Linear Algebra and Its Applications gives both an intuitive feel to linear algebra and the geometry that accompanies most linear algebra ideas in two or three dimensions, which can then be generalized to  $n$  dimensions. Strang provides a multitude of examples of each idea and a great set of exercises for the reader to try.
