In these examples mercury is not a fuel. In order to vaporize and accelerate the mercury ions you need some other source of energy. The role of the mercury in this (ionic motors, I think) is somewhat similar to the role of water in a steam engine. Water is vaporized and the high pressure vapors are used to push the pistons.

A mercury vapour turbine is a form of heat engine that uses mercury as the working fluid of its thermal cycle. A mercury vapour turbine has been used in conjunction with a steam turbine for generating electricity. This example of combined cycle generation was not widely adopted, because of high capital cost and the obvious toxic hazard if the mercury leaked into the environment.
