Maple Training: Numerical Approximation

Deriving analytical solutions in Maple is a cumulative process. This means that the more specific the answer is that you're looking for, the more steps you have to take to derive that answer. In general, deriving analytical solutions is a two step process, which is solving for a general solution and then solving for the particular solution.

2 + y2 = 1 The solution of this system is the intersection of a circle with a graph of a cosine function. Maple can easily draw a graph of these equations and give us a rough idea of the solutions. > plots[implicitplot]({y=2*cos(5*x), x^2+y^2=1}, x=-1..1, y=-2..2); The solve command cannot solve this system.

because this equation has no solutions. Sometimes, fsolve chooses its initial approximation poorly and subsequently is unable to find a solution even if it exists. In this case Maple returns a message to this effect, and suggests choosing a "different" starting interval. In this case, using the second version of fsolve with specified domain will

VI. First Order Polynomial Approximation. If you look at the Maple file, the approximation of the sequence is the last y term of the sequence, which in this case is y 10 =1.443523310. For each step in the sequence, the expansion requires 3 addition, 1 subtraction, 3 multiplication, and 1 division operations.
